Physical Vapor Deposition (PVD) coatings are extremely thin, usually .05 microns thick. The process involves the deposition of zirconium nitride, titanium nitride, or other metallic ion combinations under low vacuum conditions. The PVD process provides a dense coating that resists wear and discoloration.

Due to several characteristics of PVD coating: high hardness and wear resistance, no discoloration or tarnishing, high corrosion resistance and no attack by UV radiation, PVD coating is applied to stainless steel and titanium body jewelry and last long time.
